

TASK: Program to find substring is present in given string sentence and count its occurrence without using list

Program Logic:

1. Take input from user for string
2. Use find() string function to check if string is present
3. Use count() string function to count the number of occurrence of given substring

In [9]:

```
string = input("Enter the string here: ")
word = input("Enter the substring or word here: ")

if (string.find(word) != -1):
    print("String contains the substring")
else:
    print("String doesn't contain the substring")

count = string.count(word)
print("The count is: ",count)
```

```
Enter the string here: Betty bought the butter but the butter was bitter so
betty bought another butter to make the bitter butter better
Enter the substring or word here: butter
String contains the substring
The count is: 4
```
